ABOUT SETTING INDICATION

The proximity sensor can detect objects reliably by bringing the proximity sensor close to the target object and setting the sensor at the position where the indicator lamp changes from red to green.

Note: When the target object is made of a different material such as aluminum, copper and stainless steel to the standard target object (iron), the setup point where the indicator lamp changes color is shorter than 80% maximum.

PRECAUTIONS

1. Mounting

Tighten the screws to the torque shown below.

Catalog listing	Allowable tightening torque (N-m)	Recommended screw diameter
FL2S-4□6□	0.5	Screw provided
FL2R-4□6□	0.5	M3

2. Influence of surrounding metal

Metal other than the object surrounding the sensor may influence operating characteristics. Maintain the following space between the switch and surrounding metal.

Note: Shaded areas indicate surrounding metal other than the target object.

Catalog listing	A(mm)	B(mm)
FL2S-4□6H	20	10
FL2S-4□6S	10	20
FL2R-4□6H	20	10

FL2R-20□6H	80	40
FL2R-20□6S	40	80

3. Mutual interference prevention

When mounting proximity sensors in parallel or facing each other, mutual interference may cause the sensor to malfunction. Maintain at least the spaces indicated in the figures above. When standard frequency types and different-frequency types “-F” are used alternately in a row, maintain at least the spaces indicated in parentheses “()” for dimensions A and B in the table below.

4. Cautions for series or parallel connection

4.1 Series connection (AND connection)

When connecting two or more proximity sensors in series, erroneous output (1 to 3ms) may occur without the rated current being supplied to each of the sensors. For this reason, series connection of proximity sensors is not recommended. However, if proximity sensors must be connected in series, a resistor of 10kΩ must be provided in parallel to each of the sensors. However, note that the maximum leakage current in a series connection will be 3.5mA. Operation lag also will occur, resulting in increased voltage drop, and the operation indicator lamp will not light.

$$\text{Operation lag} = 40\text{ms} \times (\text{number of series connections} - 1)$$

$$\text{Voltage drop} = \text{voltage drop of single sensor} \times \text{number of series connected sensors}$$

4.2 Parallel connection (OR connection)

- When connecting two or more proximity sensors in parallel, leakage current increases as follows, and may result in faulty load restore. (Leakage current = Leakage current of single sensor x number of series connected sensors)
- When two or more sensors turn ON in a parallel connection, one (or some) of the sensors may not indicate operation. This is not an abnormality.

5. Relay loads

The voltage drop of the FL2R/S Series is 3.3V. Pay attention to this voltage drop when using a relay load. (With 12Vdc relays, switching is not possible.)

6. Operation upon power ON

After the power is turned ON, it takes 40ms or less until the proximity sensor is ready for sensing. When the load and the proximity sensor use different power supplies, be sure to turn the proximity sensor ON before turning the load ON.

7. Influence of leakage current

Minimal current flows as leakage current for operating the circuits even when the proximity sensor is OFF.

Take sufficient care when restoring connected loads.

8. Minimum cord bending radius (R)

The minimum bending radius (R) of the cord is 3 times cord diameter, take care not to excessively bend the cord beyond this radius. Also, do not excessively bend the cord within 30mm of the cord lead-in port.
